

Kineo Project Proposal

1. Introduction

Planning for an upcoming trip can seem overwhelming with all the numerous decisions involved, such as different airlines, managing timelines, comparing budget choices and more. Although applications such as Wego and Trip make the process clear and simple, users still often face problems of uncertainty and information overload when opting for optimal decisions. The Kineo app aims to address these challenges with the help of readable design, optimized decision making, and Artificial Intelligence.

2. Background and Objectives

This project proposes a way to help reduce complexity by introducing AI as a bridge. AI will analyze the user's options and preferences to provide a more user-friendly, efficient trip process, and a personalized travelling experience. In this way, users can plan with only a few clicks.

3. Objectives

- To design an AI-powered travelling and planning system that collects users preferences such as the budget, timelines, and the destination itself and generates optimized trip recommendations.
- To reduce complexity, challenging decision making, and information overload by designing a simplified, user-friendly, and understandable interface.

4. Methodology

The scope of this project is to create and design an app that enables users to have a personalized travelling plan efficiently and with minimal effort. The final outcome of this is to produce a functional and user-friendly user interface that collects preferences to produce affordable price ranges, flight and destination recommendations, and doable timelines.

The project will undergo multiple phases such as initial phase, design phase, development phase, and the testing phase. The initial phase will involve requirement analysis and informational research of existing apps similar to the project itself. Followed by the design phase wherein it includes designing app UI prototypes. The development phase will focus on the coding process(front-end and back-end), and implementation of AI.

5. Testing

The testing phase will include the functional testing, its usability, further error detection, and the overall testing of performance.

6. Timeframe

	Task	Start and End Dates
Initial Phase	- Research of the problems, in line, with the project. - Analysis of pre-existing travel apps.	18/01/2026 - 01/03/2026
Design Phase	- Create a prototype of the user interface design. - Logo creation, color scheme generation, and more.	01/03/2026 - 04/03/2026
Development Phase	- Creating the actual product and system. - Code creation.	01/03/2026 - 30/04/2026
Evaluation Phase	- Creating the evaluation progress report.	25/04/2026 - 29/04/2026

7. Project Deliverable

At the end, a fully functional prototype of the KINEO app will be developed and will successfully be launched in the market. The final product will show the effectiveness of introducing Artificial Intelligence aiding travellers to access the world with ease and little to no problems.

8. Project Assumptions and Constraints

Assumptions:

- ❖ Provides complete information such as a calendar for time ranges, budget, destinations, etc. and AI will focus on destination recommendations rather than more complicated and advanced generation.

Constraints:

- ❖ Firstly, intermediate level AI only applied across the whole platform. Secondly, no paid or other APIs (Google Flights, Airline, etc.). And lastly, no real time bookings have been added as of the moment.
